

Ethical Hacking and Countermeasures

Version 6

Module XXII

Linux Hacking

Bryan was a network administrator with top-shoppo.com, a small online shopping portal. He was an expert on Windows Platform but lacked in other OS. Due to strategy changes the portal was shifting from Windows to Linux systems, and because of time and human resource constraints Bryan was entrusted with the responsibility of installing Linux in their systems. While installing Linux, Bryan selected default options as he was not familiar with the kernel components of Linux. Within a week, the portal was hacked and their systems were taken off the Internet.

What went wrong?

Attack Against Linux Apache Servers Intensifying

Ellen Messmer, Network World

20 recommend 

Tuesday, January 22, 2008 4:00 PM PST

A mass attack ongoing for the past month against [Linux Apache Web servers](#) has become increasingly successful because its break-in method makes use of an automated password and installation process, according to a [security](#) researcher monitoring its progress.

[Don Jackson](#), senior security researcher at [SecureWorks](#), says the attack, which was first thought to have compromised several hundred Web sites, has hit at least 10,000. He says the attack relies on making use of stolen passwords to Linux Apache servers by automating the installation process to force it to serve up attacks against vulnerabilities on [Windows](#) clients.

"The Web server ends up serving up vulnerabilities from 2006 related to Windows malware," Jackson says. "The whole attack is very mysterious. It's based on a botnet but it doesn't match the Russian and Chinese groups and may be Western Europe or North American."

The attack, which makes use of the well-known Rbot and Sdbot malware, targets at least nine software vulnerabilities associated with [QuickTime](#) exploits, [AOL SuperBuddy](#) and [Yahoo! Messenger](#) to try and compromise Windows-based desktops. [SecureWorks](#) says most antivirus vendors can detect the malware.

The ingenuity is that the attacker has managed to install code that modifies Apache memory to monitor requests and inject the script tag, script contents or the Rbot executable, according to SecureWorks. Some Linux Apache network managers are finding it hard to clean their servers of the attack code, he notes.

Excuse me sir: there's a rootkit in your master boot record

By [Dan Goodin in San Francisco](#)

Published Wednesday 9th January 2008 05:34 GMT

Security mavens have uncovered a new class of attacks that attach malware to the bowels of a hard drive, making it extremely hard to detect and even harder to remove.

The rootkit modifies a PC's master boot record (MBR), which is the first sector of a storage device and is used to help a PC locate an operating system to boot after it is turned on. The result: the rootkit is running even before Windows loads. There have been more than 5,000 infections in less than a month, researchers say.

"Master boot record rootkits are able to subvert the Windows kernel before it loads, which gives it a distinct stealth advantage over rootkits that load while Windows is running," said Matthew Richard, director of the rapid response team for iDefense, a security provider owned by VeriSign. "It gives it a great stealth mechanism that allows it to persist even after removal." Such rootkits can even survive reinstallation of the operating system, he said.

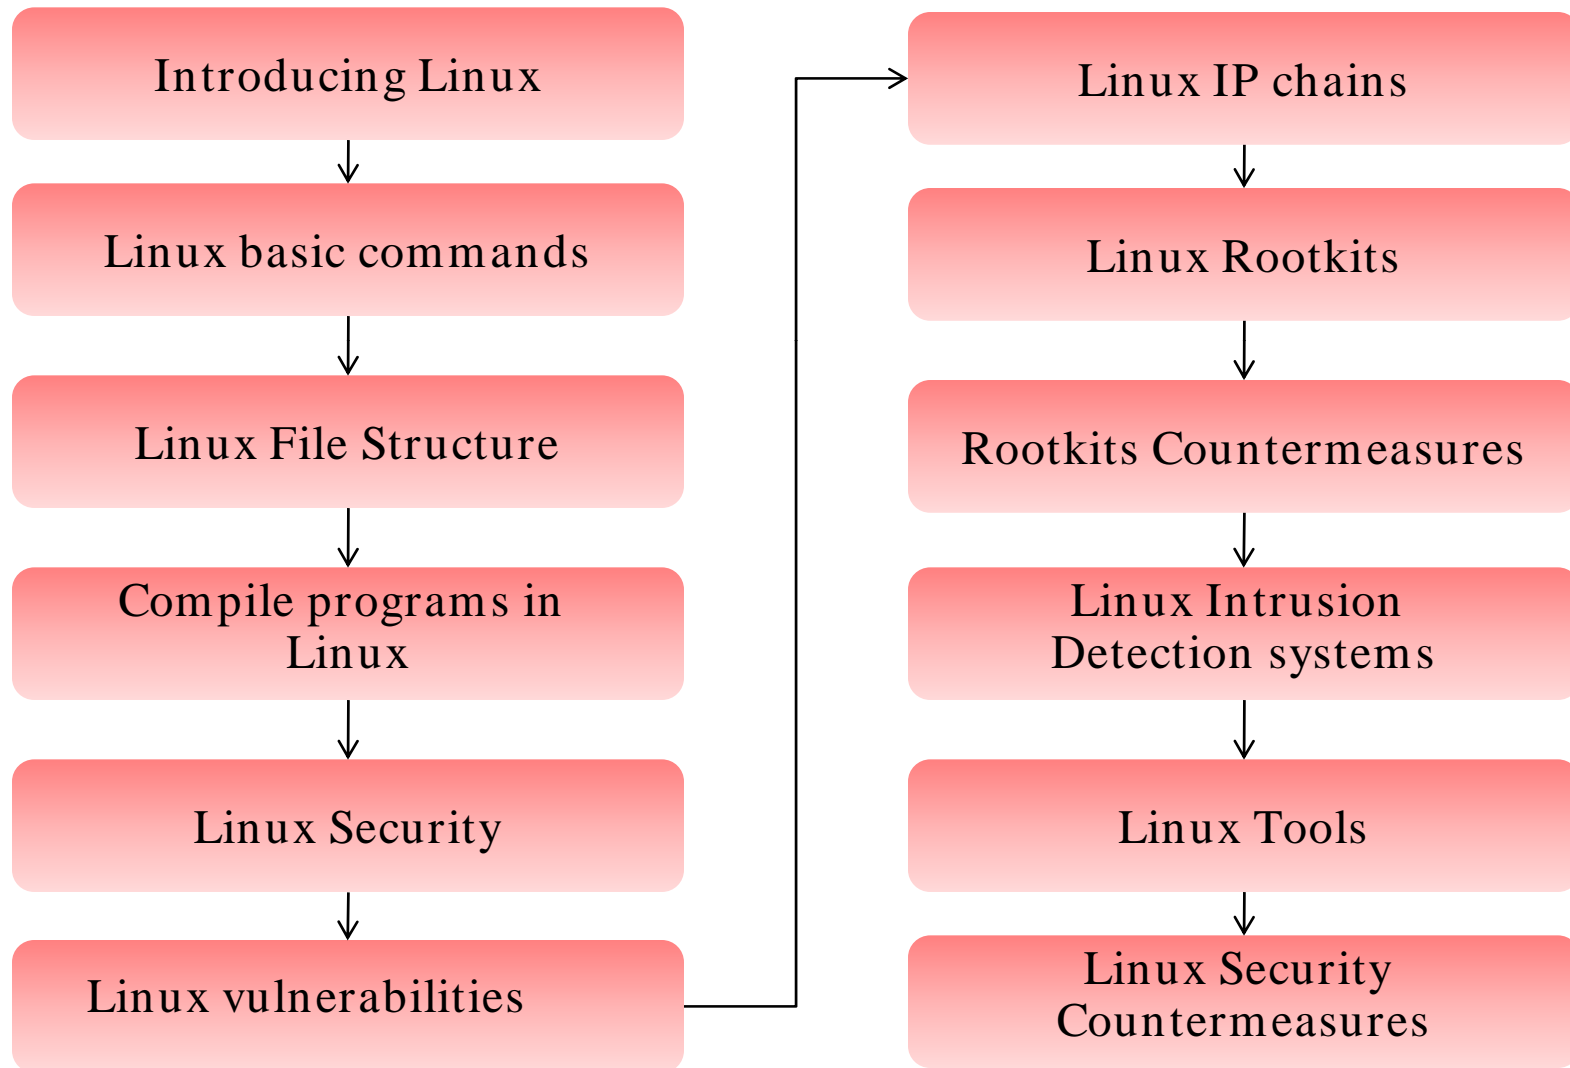

Because the rootkit lurks deep within the hard drive, well below the operating system, most antivirus programs don't detect the malware. Symantec's antivirus program is an exception, however. It labels the pest Trojan.Mebroot, according to Javier Santoyo, a senior manager for emerging technologies at Symantec.

This module will familiarize you with:

- Linux
- Basic Commands in Linux
- Linux File Structure
- Compiling Programs in Linux
- Linux Security
- Linux Vulnerabilities
- Linux IP chains
- Linux Rootkits
- Rootkit Countermeasures
- Linux Intrusion Detection systems
- Tools in Linux
- Linux Security Countermeasures

Module Flow

Majority of servers around the globe are running on Linux/ Unix-like platforms

Linux is easy to get and easy on the wallet

There are many types of Linux-Distributions/ Distros/ Flavors, such as Red Hat, Mandrake, Yellow Dog, Debian, and so on

Source code is available in Linux

Linux is easy to modify

It is easy to develop a program on Linux

CEHTM Linux Distributions

Certified Ethical Hacker

Source: <http://distrowatch.com>

Aliased commands can pose a security threat if used without proper care

Linux shell types - `/sh`, `/ksh`,
`/bash`, `/csh`, `/tcsh`

Linux user types, groups, and permissions

Overview of linux signals, logging and `/etc/securetty`

Linux Live CD-ROMs

A LiveCD is an operating system (usually containing other software as well) stored on a bootable CD-ROM that can be executed from it, without installation on a hard drive

Knoppix Live CDs are widely used in the Linux community

It is completely customizable

Source: <http://www.knoppix.org>

Basic Commands of Linux: Files & Directories

Everything is a file

256 characters maximum

They are case sensitive

Extension not necessary

Special characters

- Begin with . (period)
- Don't use / , ? , * , -
- Avoid spaces; use underscores instead

Basic Commands of Linux (cont'd)

File system

- Hierarchical tree
- No drive letters
- Starts at root with /

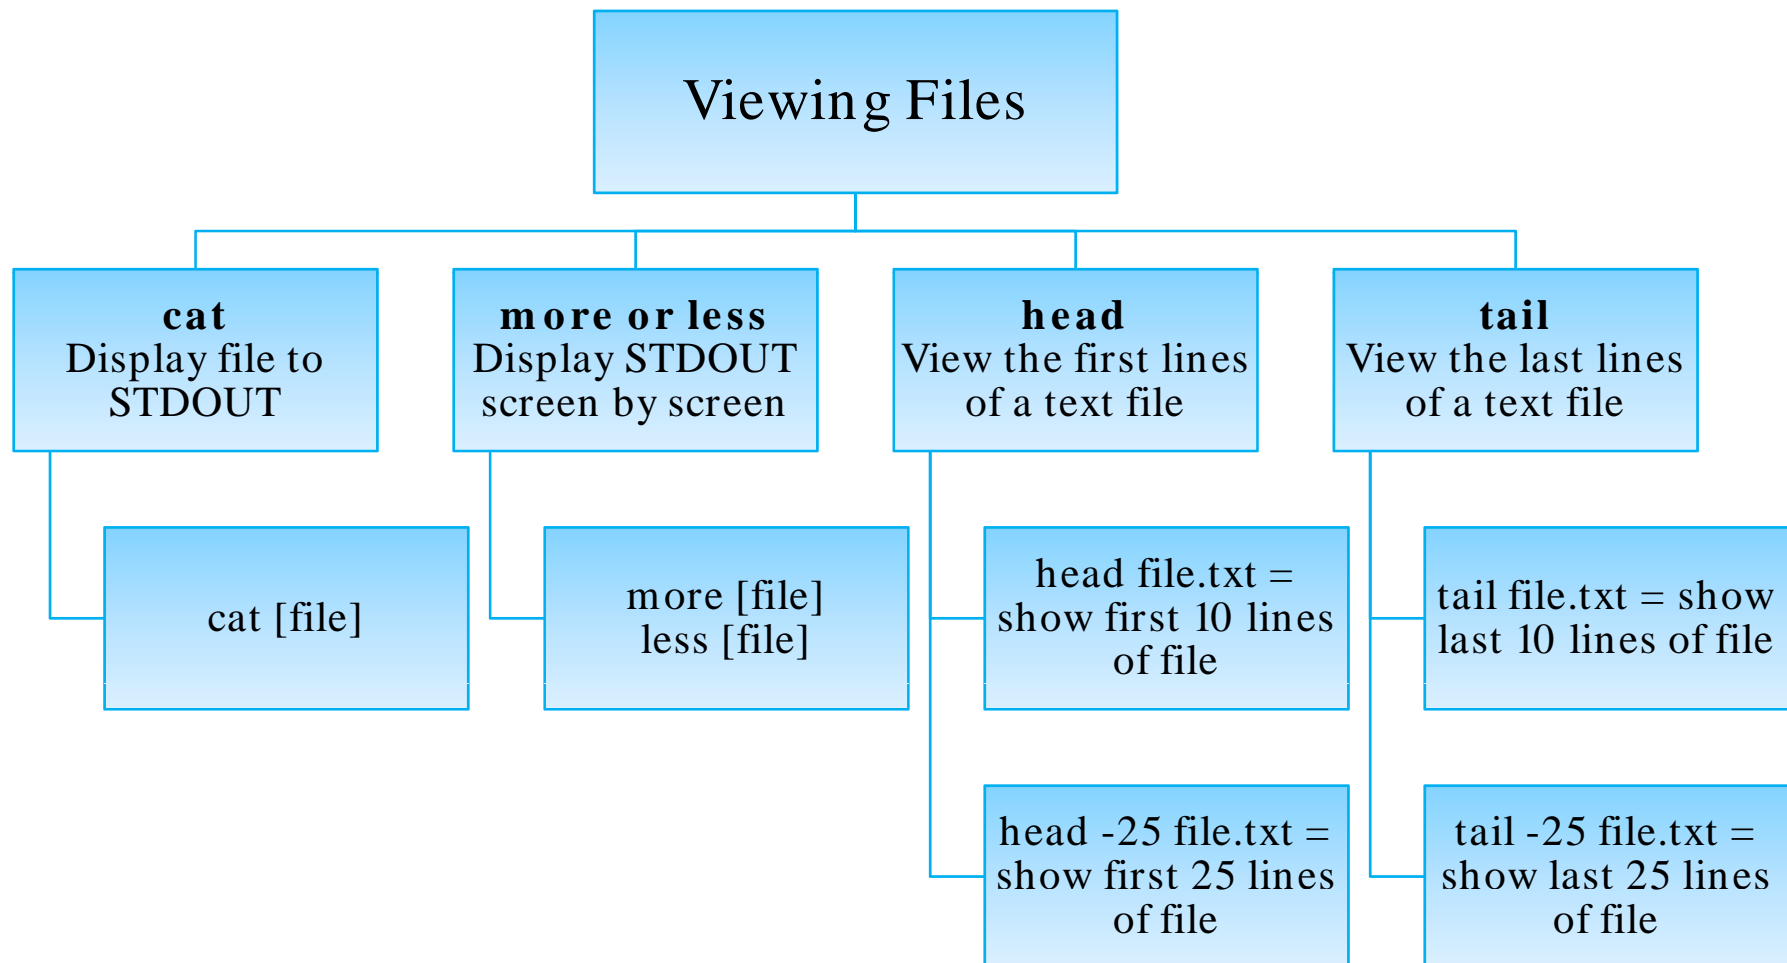

Getting Information

- **man**
- **man [command]**
- **Within man:**
 - spacebar/f = forward
 - b = back
 - q = quit
 - / = search forward
 - ? = search backward
 - n = repeat search

Basic Commands of Linux (cont'd)

Basic Commands of Linux (cont'd)

Getting Around

- `cd . cd ~`
- `cd . cd ..`
- `ls . ls -a`
- `ls -l`

Files & Directories

- `cp`
 - `cp file newfile`
- `mv`
 - `mv file newfile`
- `mkdir`
 - `mkdir [directoryname]`
- `rm`
 - `rm file`
- `find`
 - `find / -name *gnome* -print`

Linux File Structure

```
lrwxrwxrwx # owner group size_in_bytes last_modified_date_&_time filename.txt  
^ \_ / \_ / \_ /  
| v v v  
| | | |  
| | | World permissions  
| | |  
| | | Group permissions  
| | |  
| | | Owner permissions  
|
```

Type of file:

= file

l = link

d = directory

b = block device (disk drive)

c = character device (serial port or terminal)

Linux Networking Commands

arp

- Command is mostly used for checking existing Ethernet connectivity and IP address

ifconfig

- Command line tool configures or checks all network cards/interfaces

netstat

- Summary of network connections and status of sockets

nslookup

- Checks the domain name and IP information of a server

ping

- Sends test packets to a specified server to check if it is responding properly

Linux Networking Commands (cont'd)

ps

- Lists all existing processes on the server

route

- Lists the routing tables for your server

shred

- Deletes a file securely by overwriting its contents

traceroute

- Traces the existing network routing for a remote or local server

ps

- The ps command displays all of the existing processes

Directories in Linux

bin

- Binary files (executables)

sbin

- System binary files (to be used by administrators)

etc

- Configuration files

include

- Include files

lib

- Library files

src

- Source files

doc

- Document files

man

- Manual files

share

- Shared files

Installing, Configuring, and Compiling Linux Kernel

Download the latest kernel from www.Linux.org

Step 1

- login as 'root'
- `'cp linux-2.4.2.tar.gz /usr/src/'`
- `'cd /usr/src/'`
- Check the source of old kernel in `_usr/src/linux`
- Move the current version `'mv /usr/src/linux linux-XX.X'` as a backup for future use
- `'tar -zxvf linux-2.4.2.tar.gz'`
- Move new Kernel source, `'mv /usr/src/linux /usr/src/linux-2.4.2'`
- Create a link to it `'ln -s /usr/src/linux-2.4.2 /usr/src/linux'`

Installing, Configuring, and Compiling Linux Kernel (cont'd)

Step 2

- Configure the Kernel
 - `cd` to your kernel source directory in `/usr/src`
 - Type `make menuconfig` if you prefer text mode, but `xconfig` is recommended

Step 3

- Go back to your command line and type `make dep` for kernel compilation

Step 4

- Clean all the files (.o, or object files) created during compilation
 - `Make clean`

Step 5

- Create a bootable Linux image (actual Linux file)
- Make bzImage
- Make new modules for installation
- Make modules
- After finishing compilation type
- Make modules_install
- Move the BzImage file to the location of the kernel
- `mv/ usr/ src/ linux-2.4.17/ arch/ i386/ boot/ bzImage / boot/ vmlinuz-2.4.17`

Step 6

- Locate the new file to linux boot manager LILO
- Edit the file `etc/lilo.conf`, add these lines
- `mage=/boot/vmlinuz-2.4.17`
`label=linux-2.4.17`
`root=/dev/hda3`
`read-only`
- Save the `lilo.conf` file
- Run the `lilo` program `/sbin/lilo`
- Reboot the machine

Installing, Configuring, and Compiling Linux Kernel (cont'd)

Linux Kernel Configuration: File systems

```
File systems --->
<*> Reiserfs support
<*> Ext3 journalling file system support
<*> JFS filesystem support
<*> Second extended fs support # this is the ext2 filesystem
<*> XFS filesystem support
```

Linux Kernel Configuration: Ethernet Controller

```
Device Drivers --->
Networking support --->
  Ethernet (10 or 100Mbit) --->
    EISA, VLB, PCI and on board controllers
      <*> RealTek RTL-8139 PCI Fast Ethernet Adapter support
```

How to Install a Kernel Patch

Download the Linux kernel patch from www.linux.org

Copy the downloaded kernel to `/usr/src/linux` directory

Navigate to the downloaded directory `cd /usr/src/linux`

Extract the patch into the `/usr/src/linux` directory using tar, gzip, etc.

A file named `patch-2.x.x` or `patch-2.x.x-yy` should be created in the `/usr/src/linux` directory

To apply the patch to the kernel, run `patch -p1 < patch-2.x.x` or `patch -p1 < patch-2.x.x-yy`

GCC is a command line based compiler

It can be used to compile and execute C, C++, and Fortran code

Many Linux installations include a version of GCC compiler by default

You can download the latest version from <http://gcc.gnu.org>

Most Linux hacking tools are written in C. When you download a hacking tool source, it will often be C or C++ source code. You do not need to know C++ programming to compile a program

- Here is a simple c++ code:

```
#include <iostream>

int main ()
{
    std::cout << "Hello,
world!\n";
    return 0;
}
```

- To compile the above code:

```
gcc -Wall hello.c -o hello
```

- To run the program:

```
./hello
```

- ◉ Read the program's [README](#) or INSTALL file for instructions on how to compile the program
- ◉ Sometimes, the compile command for some programs can be very long
- ◉ A Makefile is a command file for compiling programs
- ◉ For example, assume that you have a graphics program called face.cpp, and that the compile line is:
 - `g++ -o face face.cpp -L/usr/X11R6/lib -lm -lX11 -lgd -lg2`
- ◉ You would create a file named "Makefile", and in it you would put the lines
 - `face: face.cpp g++ -o face face.cpp -L/usr/X11R6/lib -lm -lX11 -lgd -lg2`
- ◉ Now to compile face, you would use the command:
 - `make` or
 - `make face`

Make Install Command

There are four commands to compile, link, and install a program

- `./configure` (may not have this)
- `make`
- `make install`
- `make clean`

The `make` utility handles compiling and linking

`make install` puts the compiled binary file in the proper (`/usr/local/bin`) subdirectory

`make clean` cleans up temporary files that were generated by the compiling and linking processes

Linux Vulnerabilities

The number of unexploited vulnerabilities in the core Linux kernel is on the rise

The U.S. Computer Emergency Readiness Team, or CERT, reported that more Linux and Unix combined had more than 2,328 vulnerabilities, compared with 812 vulnerabilities for Microsoft Windows

Since the source code for any given Linux project is so widely circulated, it is available to every hacker in the world

Vulnerabilities were announced in many packages, including:

- apache, balsa, bind, bugzilla, cdrecord, cfengine
- cron, cups, cvs, ethereal (many), evolution, exim, fetchmail (many), fileutils
- gdm, ghostscript, glibc, gnupg, gzip, hylafax, inetd, iproute, KDE, kerberos, kernel
- lprng, lsh, lynx, mailman, man, mozilla, mpg123, mplayer, mutt, MySQL, openssh, openssl
- perl, pine, PHP, postfix, PostgreSQL, proftpd, python, rsync, samba, screen, sendmail, snort, stunnel, sudo, tcpdump, vim, webmin, wget, wu-ftpd, xchat, XFree86, xinetd, xpdf, and zlib

Linux Vulnerabilities (cont'd)

Linux is an open source Operating System with many vendors providing different security options

Unlike other OSs, Linux is not secure

Linux is optimized for convenience and does not make security easy or natural

The security on Linux will vary from user to user

Linux security is effectively binary: all or nothing in terms of power. Facilities such as setuid execution tend to give way in the middle

Why is Linux Hacked

Linux is widely used on a large number of servers in the world, making it a 'de facto' backbone

Since application source code is available, it is easy to find out the vulnerabilities of the system

Many applications on Linux are installed by default so they are more vulnerable to attacks

There are many default installed setuid programs

There are many default installed daemons

- The admin must remove unused daemons
- Change `/etc/rc.d` files and `/etc/inetd.conf` file

How to Apply Patches to Vulnerable Programs

Check the Linux distribution homepage e.g., Redhat, Debian, Alzza, and so on

Go to the respective websites of the vendors from whom the user has bought the program and downloaded the patches

Scanning Networks

Once the IP address of a target system is known, an attacker can begin the process of port scanning, looking for holes in the system through which the attacker can gain access

A typical system has $2^{16} - 1$ port numbers with one TCP port and one UDP port for each number

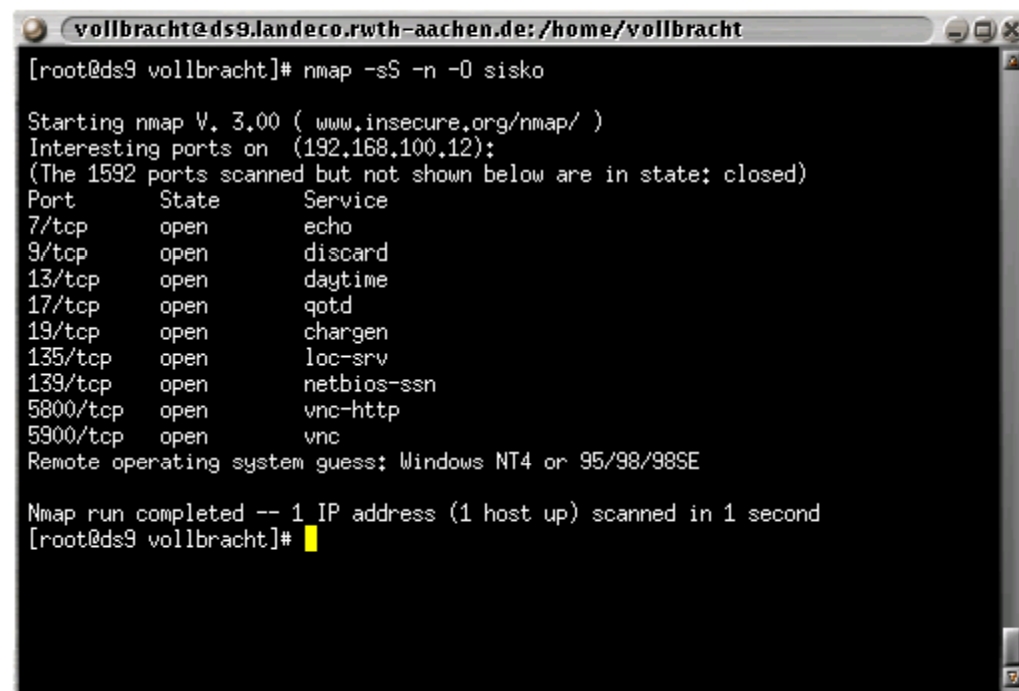

Each one of these ports is a potential way into the system

The most popular scanning tool for Linux is Nmap

Nmap is a tool used for determining the hosts that are running and what services the hosts are running

Nmap can be a valuable diagnostic tool for network administrators

```
vollbracht@ds9.landeco.rwth-aachen.de: /home/vollbracht
[root@ds9 vollbracht]# nmap -sS -n -O sisko

Starting nmap V. 3.00 ( www.insecure.org/nmap/ )

Command:

Scanning Tool: Nessus

One essential type of tool for any attacker, or defender, is the vulnerability scanner

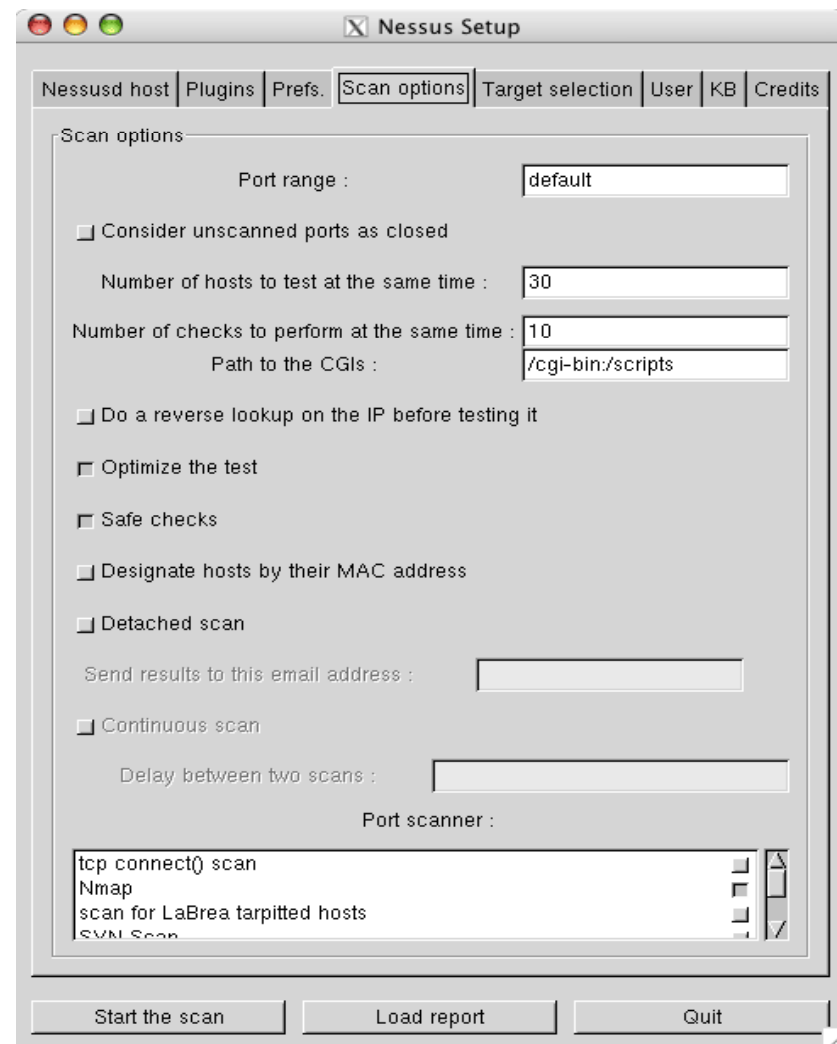

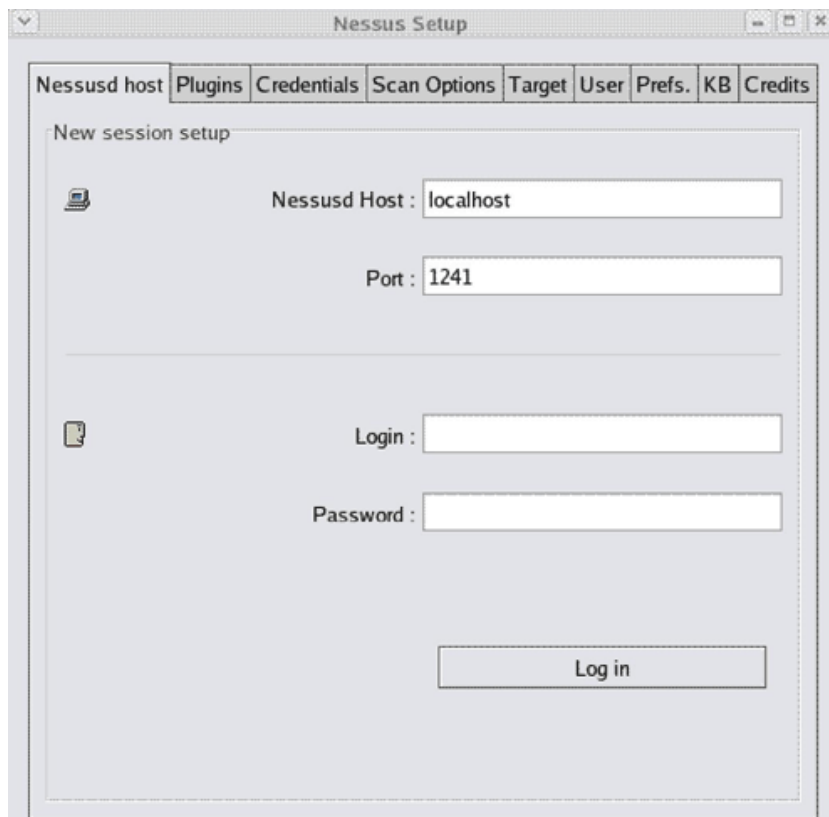

These tools allow attacker to connect to a target system and check for such vulnerabilities as configuration errors, default configuration settings that allow attackers access, and the most recently reported system vulnerabilities

The preferred open-source tool for this is Nessus

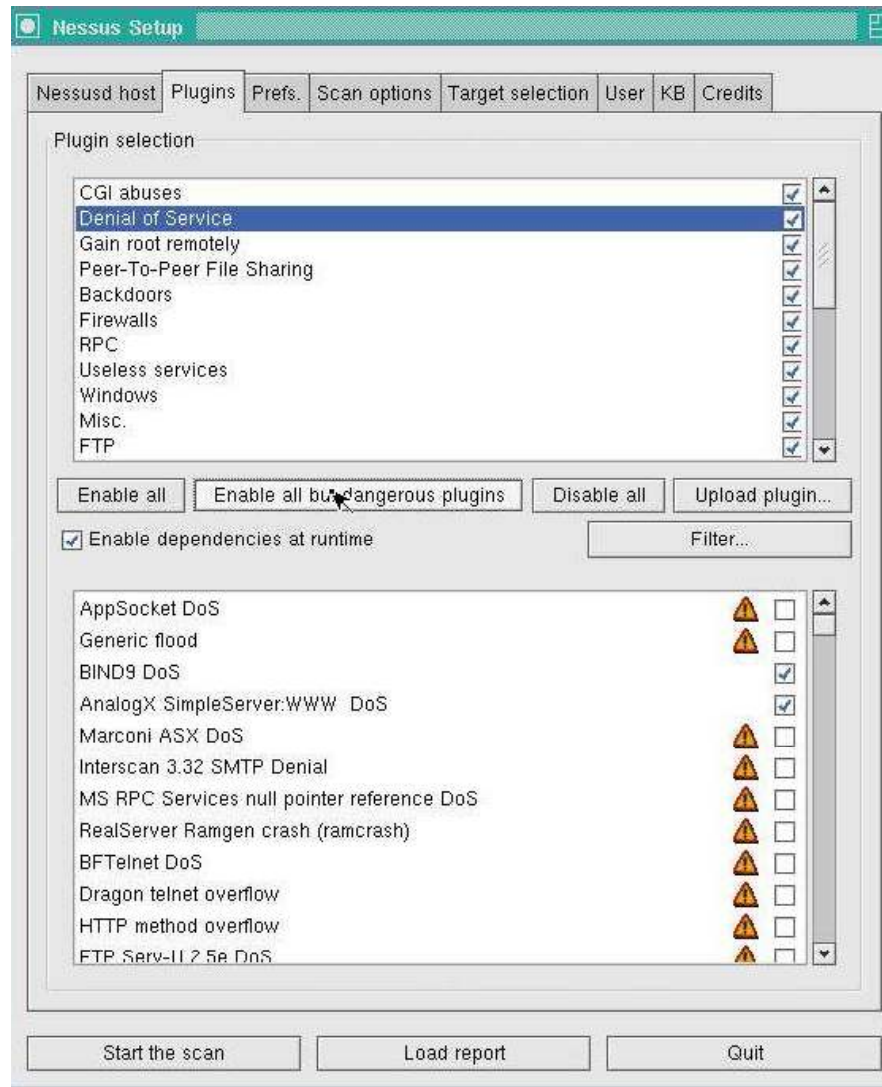

Nessus is a powerful network scanner. It can also be configured to run a variety of attacks

Nessus: Screenshot 1

Nessus: Screenshot 2

- ◉ KLAXON
- ◉ Scanlogd
 - <http://www.openwall.com/scanlogd/>
 - Detects and logs TCP port scans
- ◉ Scanlogd
 - only logs port scans
 - It does not prevent them
 - The user will only receive summarized information in the system's log
- ◉ Psionic PortSentry
 - <http://www.psionic.com/products/portsentry/>
 - Portscan detection daemon, Portsentry, has the ability to detect port scans (including stealth scans) on the network interfaces of the user's server
 - Upon alarm, it can block the attacker via hosts.deny, dropped route, or firewall rule

Password Cracking in Linux: Xcrack

Xcrack finds any passwords that match words in the dictionary file the user provides, but it would not apply any combinations or modifications of those words

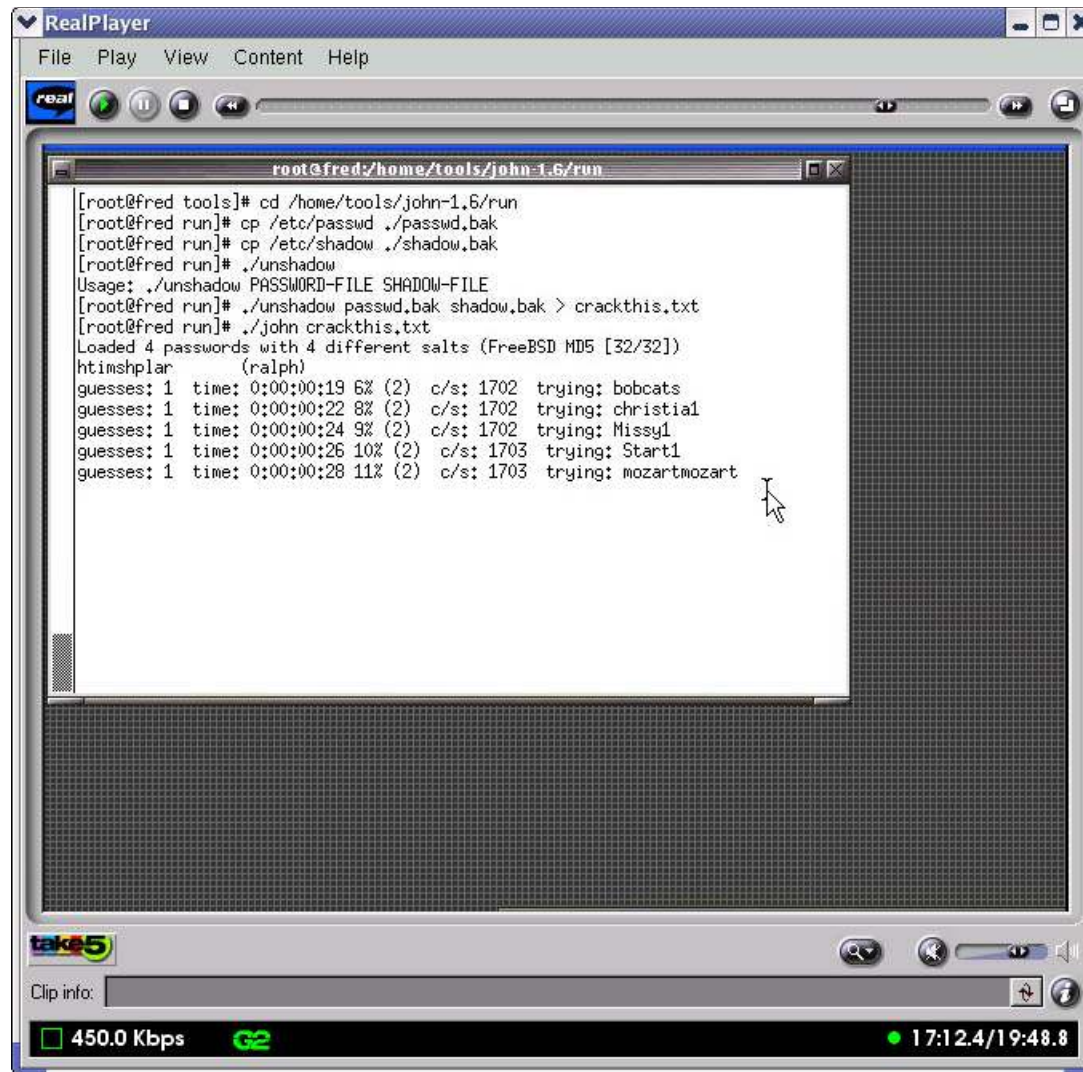

It is a comparatively fast tool

John the Ripper is another popular password cracking tool

Source: <http://packetstorm.linuxsecurity.com>

Password Cracking in Linux: Screenshot

```
root@fred:/home/tools/john-1.6/run
[root@fred tools]# cd /home/tools/john-1.6/run
[root@fred run]# cp /etc/passwd ./passwd,bak

```

Firewall in Linux: IPTables

IPTables is the replacement of userspace tool ipchains in the Linux kernel and beyond. It has many more features than IPChains

Connection tracking capability is the ability to do stateful packet inspection

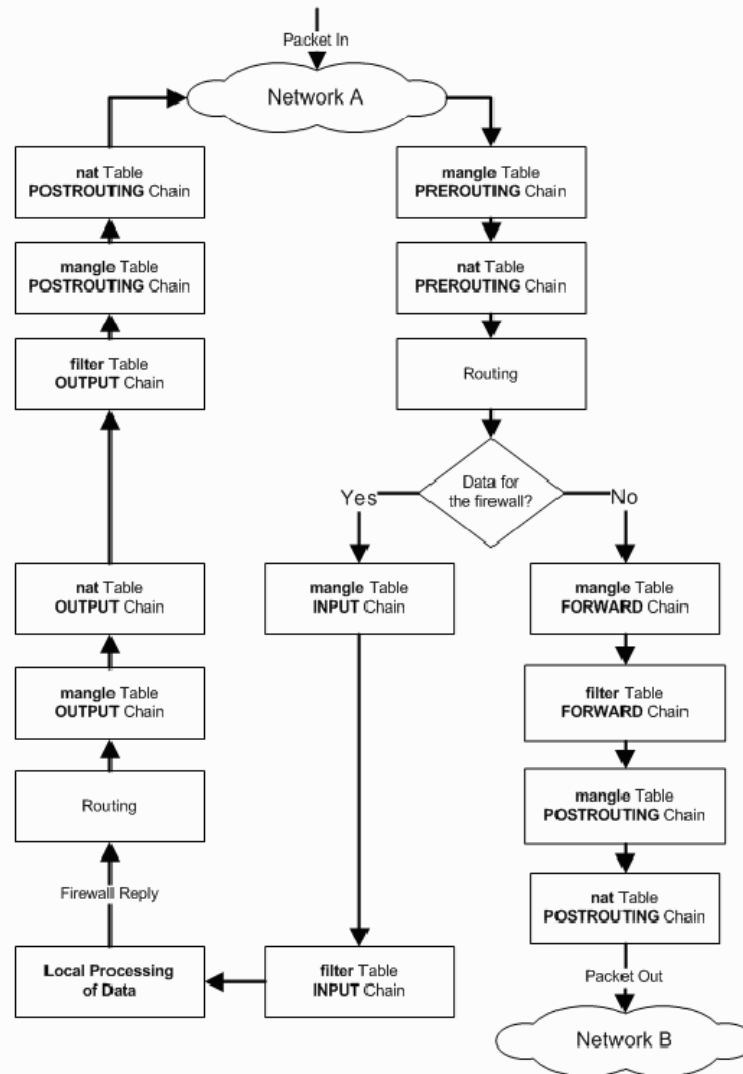

Simplified behavior of packets negotiating the built-in chains (INPUT, OUTPUT, and FORWARD)

A clean separation of packet filtering and network address translation (NAT)

Rate-limited connection and logging capability

The ability to filter on tcp flag and tcp options and also MAC addresses

Firewall in Linux: IPTables (cont'd)

IPTables Command

```
⊙ iptables -A INPUT -s 0/0 -i eth0  
-d 192.168.1.1 -p TCP -j ACCEPT
```

- iptables is being configured to allow the firewall to accept TCP packets coming in on interface eth0 from any IP address destined for the firewall's IP address of 192.168.1.1

```
⊙ iptables -A OUTPUT -p icmp --  
icmp-type echo-request -j ACCEPT  
iptables -A INPUT -p icmp --  
icmp-type echo-reply -j ACCEPT
```

- iptables is being configured to allow the firewall to send ICMP echo-requests (pings) and in turn, accept the expected ICMP echo-replies

Basic Linux Operating System Defense

Linux operating system has a number of built-in protection mechanisms that you should activate by modifying the system kernel parameters in the `/proc` filesystem via the `/etc/sysctl.conf` file

Change the `/etc/sysctl.conf` to modify kernel parameters

Basic Linux Operating System Defense (cont'd)

```
# File: / etc/ sysctl.conf
#-----
# Disable routing triangulation. Respond to queries out
# the same interface, not another. Helps to maintain state
# Also protects against IP spoofing
#-----
net/ ipv4/ conf/ all/ rp_ filter = 1
#-----
# Enable logging of packets with malformed IP addresses
#-----
net/ ipv4/ conf/ all/ log_ martians = 1
#-----
# Disable redirects
#-----
net/ ipv4/ conf/ all/ send_ redirects = 0
#-----
# Disable source routed packets
#-----
net/ ipv4/ conf/ all/ accept_ source_ route = 0
```

Basic Linux Operating System Defense (cont'd)

```
# -----  
# Disable acceptance of ICMP redirects  
# -----  
net/ipv4/conf/all/accept_redirects = 0  
# -----  
# Turn on protection from Denial of Service (DOS) attacks  
# -----  
net/ipv4/tcp_syncookies = 1  
# -----

```

SARA (Security Auditor's Research Assistant)

The Security Auditor's Research Assistant (SARA) is a third generation Unix-based security analysis tool that supports the FBI Top 20 Consensus on Security

SARA operates on most Unix-type platforms including Linux and Mac OS X

SARA is the upgrade of SATAN tool

Getting SARA up and running is a straightforward compilation process and the rest is done via a browser

Source: <http://www-arc.com>

Linux Tool: Netcat

TCP/IP swiss army knife is a simple Unix utility that reads and writes data across network connections using TCP or UDP protocol

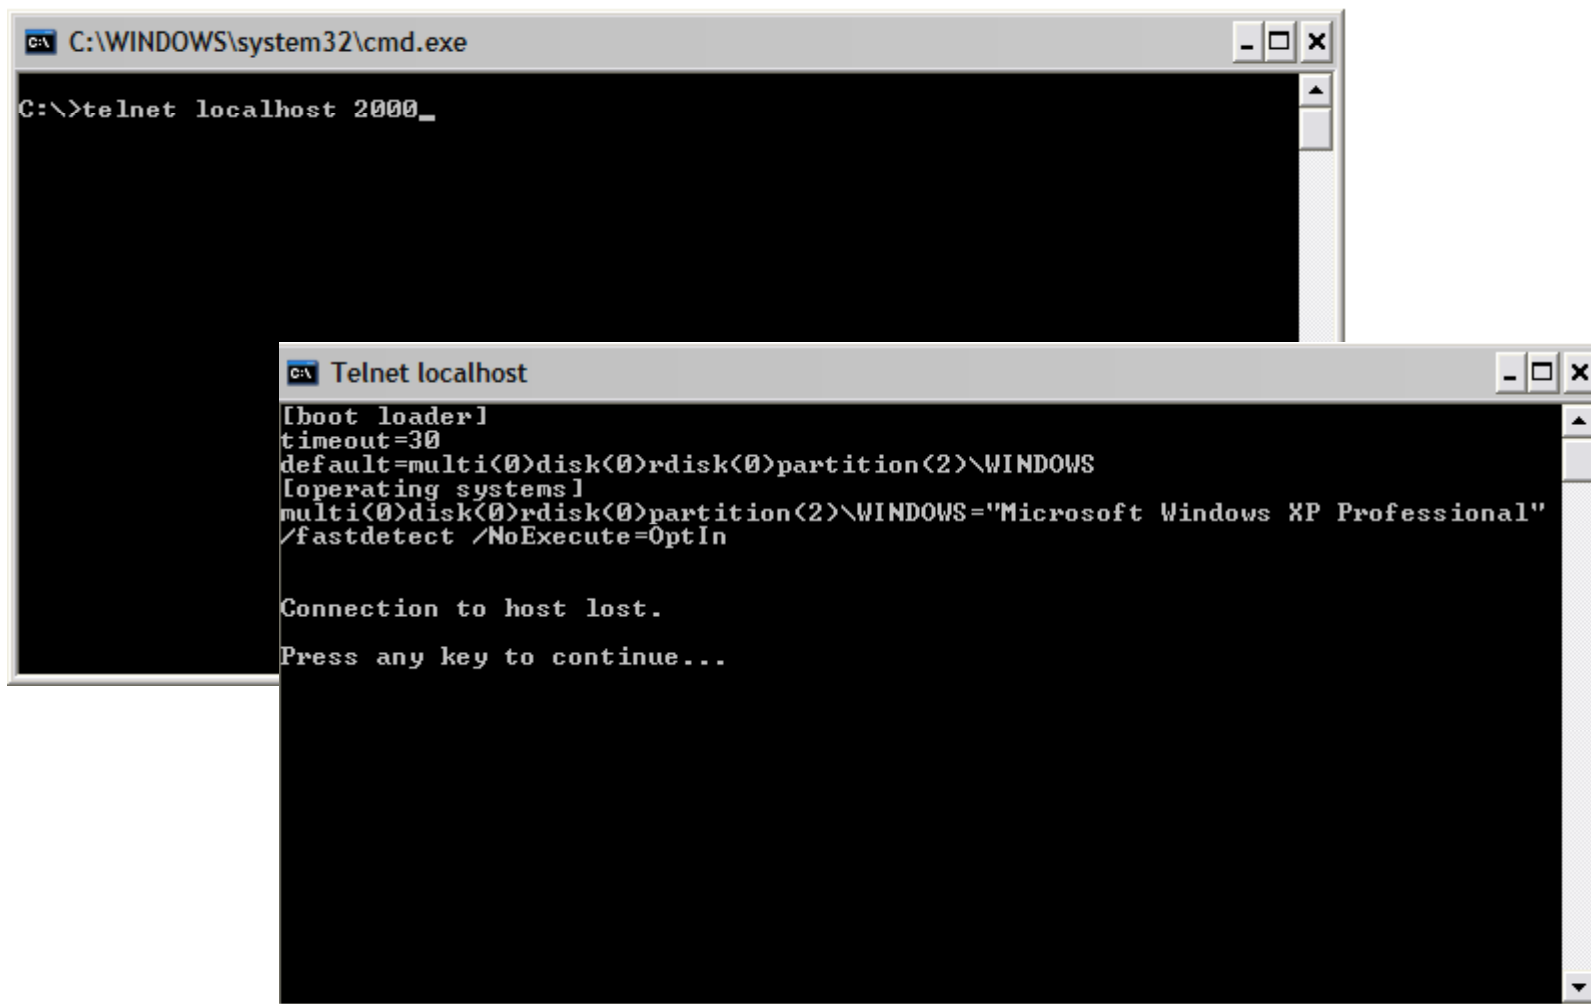

It is designed to be a reliable "back-end" tool that can be used directly or easily driven by other programs and scripts

It can create almost any kind of connection you would need and has several interesting built-in capabilities

Source: <http://www.atstake.com>

Netcat: Screenshot 1

```
C:\WINDOWS\system32\cmd.exe
C:\>telnet localhost 2000_

C:\ Telnet localhost
[boot loader]
timeout=30
default=multi(0)disk(0)rdisk(0)partition(2)\WINDOWS
[operating systems]
multi(0)disk(0)rdisk(0)partition(2)\WINDOWS="Microsoft Windows XP Professional"
/fastdetect /NoExecute=OptIn

Connection to host lost.
Press any key to continue...

Linux Tool: tcpdump

A powerful tool for network monitoring and data acquisition which allows you to dump the traffic on a network

It can be used to print out the headers of packets on a network interface that match a given expression

You can use this tool to track down network problems, to detect "ping attacks," or to monitor the network activities

Source: <http://www.tcpdump.org>

tcpdump: Screenshot 1

Linux Tool: Snort

Flexible packet sniffer/logger that detects attacks, Snort is a libpcap-based packet sniffer/logger that can be used as a lightweight network intrusion detection system

Snort has a real-time alerting capability, with alerts being sent to syslog, a separate "alert" file, or even to a Windows computer via Samba

```
F:\Snort>snort

---= Initializing Snort =---

-*> Snort! <*-
Version 1.7-WIN32
By Martin Roesch <roesch@clark.net, www.snort.org>
WIN32 Port By Michael Davis <mike@datanerds.net, www.datanerds.net/~nike>
USAGE: snort [-options] <filter options>
Options:
  -A          Set alert mode: fast, full, or none <alert file alerts only>
              "unsock" enables UNIX socket logging <experimental>. *
  -a          Display ARP packets
  -b          Log packets in tcpdump format <much faster!>
  -c <rules>  Use Rules File <rules>
  -C          Print out payloads with character data only <no hex>
  -d          Dump the Application Layer
  -D          Run Snort in background <daemon> mode
  -e          Display the second layer header info
  -E          Log alert messages to NT Eventlog.
  -F <bpf>    Read BPF filters from file <bpf>
  -g <gname>  Run snort gid as 'gname' user or uid after initialization *
  -h <hn>     Home network = <hn>
  -i <if>     Listen on interface <if>
  -I          Add Interface name to alert output
  -l <ld>     Log to directory <ld>
  -n <cnt>    Exit after receiving <cnt> packets
  -N          Turn off logging <alerts still work>
  -o          Change the rule testing order to Pass!Alert!Log
  -O          Obfuscate the logged IP addresses
  -p          Disable promiscuous mode sniffing
  -P <snap>   set explicit snaplen of packet <default: 1514>
  -q          Quiet. Don't show banner and status report
  -r <tf>     Read and process tcpdump file <tf>
  -s <server:port> Log alert messages to syslog server <default port: 514>
  -S <n=v>    Set rules file variable n equal to value v
  -t <dir>    Chroots process to <dir> after initialization
  -u <uname>  Run snort uid as <uname> user <or uid> after initialization
              Use UTC for timestamps
  -v          Be verbose
  -W          Lists available interfaces.
  -V          Show version number
  -X          Dump the raw packet data starting at the link layer
  -?          Show this information
<Filter Options> are standard BPF options, as seen in TCPDump

* denotes an option that is NOT SUPPORTED in this WIN32 port of snort.

Uh, you need to tell me to do something....

: Invalid argument

F:\Snort>

Done Internet

Linux Tool: SAINT

SAINT (Security Administrator's Integrated Network Tool) is a security assessment tool based on SATAN

Features include scanning through a firewall, updated security checks from CERT & CIAC bulletins, 4 levels of severity (red, yellow, brown, & green) and a feature rich HTML interface

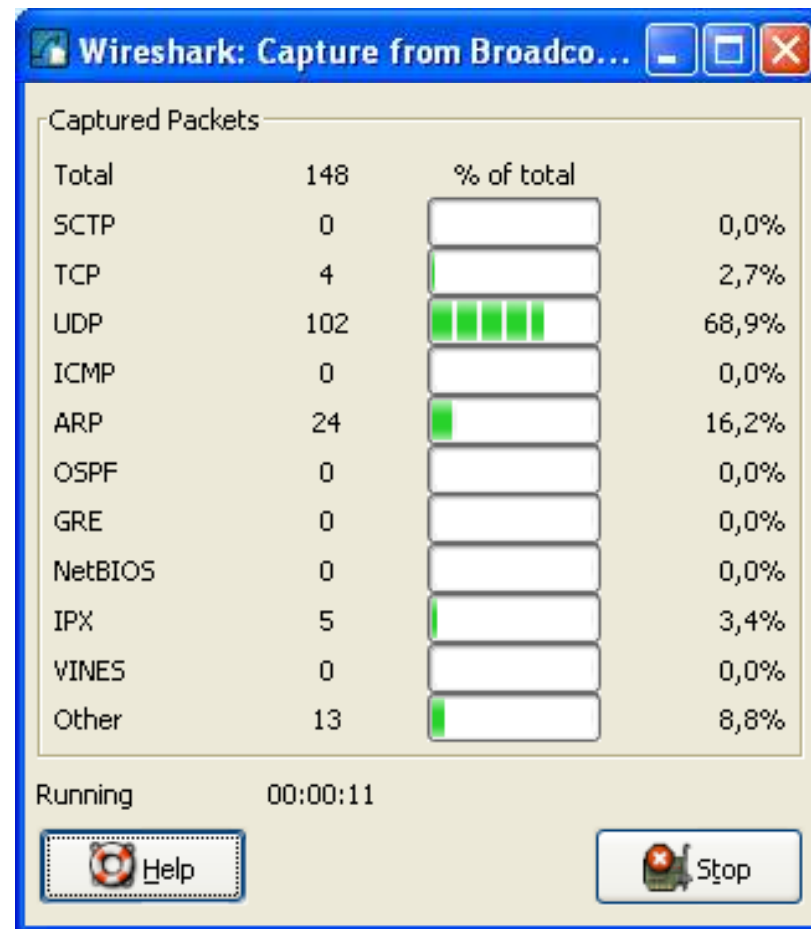

Source: <http://www.saintcorporation.com>

Linux Tool: Wireshark

Network traffic analyzer wireshark is a network traffic analyzer, or "sniffer," for Unix and Unix-like operating systems

It uses GTK+, a graphical user interface library, and libpcap, a packet capture and filtering library

Linux Tool: Abacus Port Sentry

Portscan detection daemon Port Sentry has the ability to detect portscans (including stealth scans) on the network interfaces of your machine

Upon alarm, it can block the attacker via hosts.deny, dropped route, or firewall rule

It is a part of the Abacus program suite

Source: <http://www.psionic.com>

Abacus Port Sentry: Screenshot

```
[root@clubcm portsentry-1.1]# make linux
SYSTYPE=linux
Making
cc -O -Wall -DLINUX -DSUPPORT_STEALTH -o ./portsentry ./portsentry.c \
    ./portsentry_io.c ./portsentry_util.c
[root@clubcm portsentry-1.1]#
[root@clubcm portsentry-1.1]#
[root@clubcm portsentry-1.1]# make install
Creating psionic directory /usr/local/psionic
Setting directory permissions
Creating portsentry directory /usr/local/psionic/portsentry
Setting directory permissions
chmod 700 /usr/local/psionic/portsentry
Copying files
cp ./portsentry.conf /usr/local/psionic/portsentry
cp ./portsentry.ignore /usr/local/psionic/portsentry
cp ./portsentry /usr/local/psionic/portsentry
Setting permissions
chmod 600 /usr/local/psionic/portsentry/portsentry.ignore
chmod 600 /usr/local/psionic/portsentry/portsentry.conf
chmod 700 /usr/local/psionic/portsentry/portsentry

Edit /usr/local/psionic/portsentry/portsentry.conf and change
your settings if you haven't already. (route, etc)

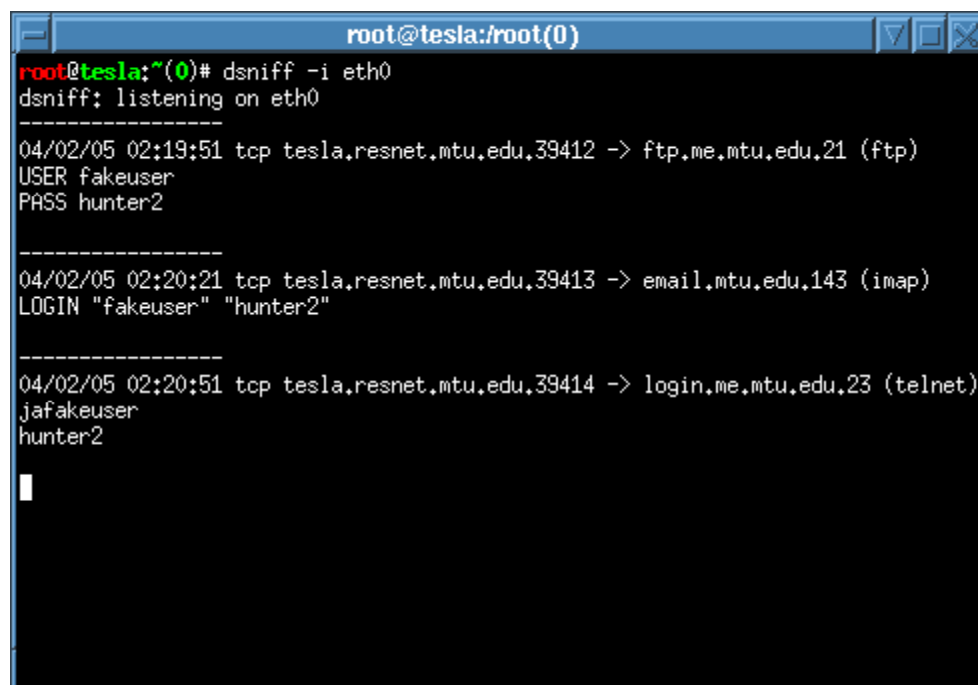

WARNING: This version and above now use a new
directory structure for storing the program
and config files (/usr/local/psionic/portsentry).
Please make sure you delete the old files when
the testing of this install is complete.

[root@clubcm portsentry-1.1]#

```

Linux Tool: DSniff Collection

A suite of powerful tools for sniffing networks for passwords and other information

Includes sophisticated techniques for defeating the "protection" of network switchers

```
root@tesla:~(0)
root@tesla:~(0)# dsniff -i eth0
dsniff: listening on eth0
-----
04/02/05 02:19:51 tcp tesla.resnet.mtu.edu.39412 -> ftp.me.mtu.edu.21 (ftp)
USER fakeuser
PASS hunter2
-----
04/02/05 02:20:21 tcp tesla.resnet.mtu.edu.39413 -> email.mtu.edu.143 (imap)
LOGIN "fakeuser" "hunter2"
-----
04/02/05 02:20:51 tcp tesla.resnet.mtu.edu.39414 -> login.me.mtu.edu.23 (telnet)
jafakeuser
hunter2
```

Linux Tool: Hping2

hping2 is a network tool which sends custom ICMP/UDP/TCP packets and displays target replies like ping does with ICMP replies

It handles fragmentation and arbitrary packet body and size and can be used to transfer files under supported protocols

Using hping2, you can test firewall rules

```
# hping2 -n 172.16.240.241 -p 21 -S -c 4
eth0 default routing interface selected (according to /proc)
HPING 172.16.240.241 (eth0 172.16.240.241): S set, 40 headers + 0 data bytes
46 bytes from 172.16.240.241: flags=SA seq=0 ttl=63 id=0 win=5840 rtt=13.7 ms
46 bytes from 172.16.240.241: flags=SA seq=1 ttl=63 id=0 win=5840 rtt=3.7 ms
46 bytes from 172.16.240.241: flags=SA seq=2 ttl=63 id=0 win=5840 rtt=3.7 ms
46 bytes from 172.16.240.241: flags=SA seq=3 ttl=63 id=0 win=5840 rtt=3.5 ms

--- 172.16.240.241 hping statistic ---
4 packets trammed, 4 packets received, 0% packet loss
round-trip min/avg/max = 3.5/6.1/13.7 ms
```

Linux Tool: Sniffit

Sniffit is a packet sniffer and monitoring tool. It is a packet sniffer for TCP/UDP/ICMP packets

It is able to give you detailed technical info on these packets (SEC, ACK, TTL, Window, etc.) but also packet contents in different formats (hex or plain text, etc)

```

Linux Tool: LIDS

The LIDS is an intrusion detection/defense system in the Linux kernel

The goal is to protect Linux systems against root intrusions by disabling some system calls in the kernel itself

Source: <http://www.lids.org/>

Hacking Tool: Hunt

Hunt is a session hijacking tool

One of Hunt's advantages over other session hijacking tools is that it uses techniques to avoid ACK storms

Hunt avoids the ACK storm, and the dropping of the connection, by using ARP spoofing to establish the attacker's machine as a relay between the source and the destination

Now, the attacker uses Hunt to sniff the packets to the source and destination to send over this connection

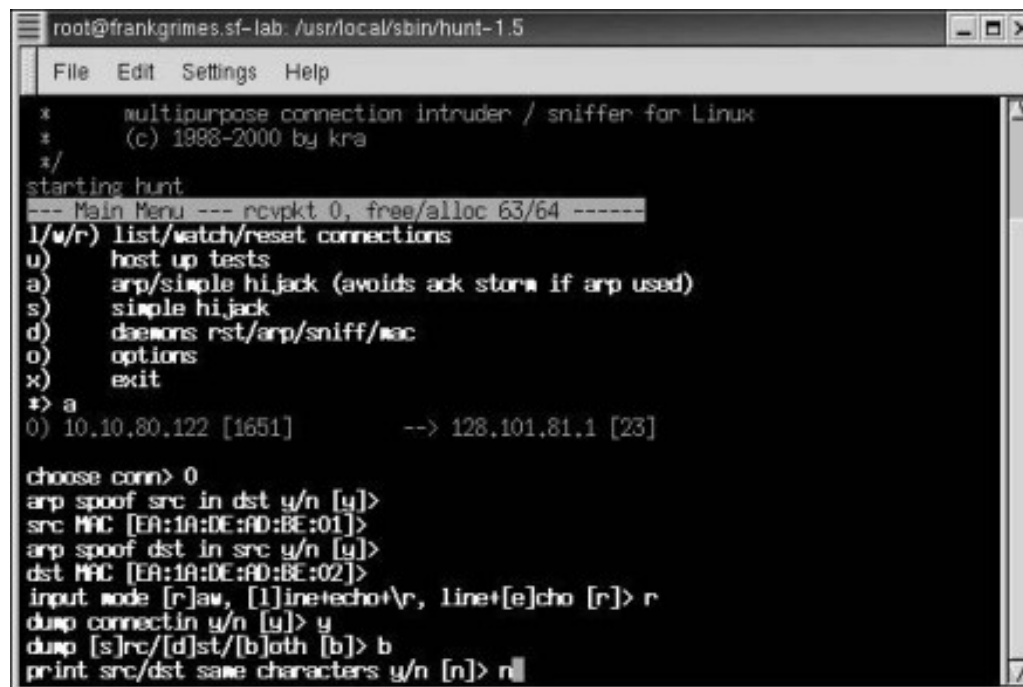

The attacker can choose to act as a relay and forward these packets to their intended destinations, or he can hijack the session

The attacker can type in commands that are forwarded to a destination but that the source cannot see

Hunt: Screenshot

Any commands the source types in can be seen on the attacker's screen, but they are not sent to the destination

Then Hunt allows the attacker to restore the connection back to the source when he/she is done with it

```
root@frankgrimes.sf-lab: /usr/local/sbin/hunt-1.5

Tool: TCP Wrappers

TCP Wrappers allow the user to monitor/ filter incoming requests for SYSTAT, FINGER, FTP, TELNET, R-Commands, TFTP, TALK, and other network services

It provides access control to restrict what systems connect with which network daemons

It provides some protection from host spoofing

It has 4 components:

- Tcpsd—the actual wrapper program
- Tcpsmatch, tcpschk—ACL testing programs
- Try-from—tests host lookup function
- Safe-finger—a better version of finger

Linux Loadable Kernel Modules

LKMs are Loadable Kernel Modules used by the Linux kernel to expand its functionality

The advantage of those LKMs: *They can be loaded dynamically*; there must be no recompilation of the whole kernel. Because of these features, they are often used for specific device drivers (or filesystems) such as soundcards

This command forces the system to do :

- Load the objectfile (here module.o)
- Call `create_module` syscall (for systemcalls -> see 1.2) for relocation of memory
- Unresolved references are resolved by Kernel-Symbols with the syscall `get_kernel_syms`
- After this, the `init_module` syscall is used for the LKM initialization -> executing `int init_module(void)` and so on

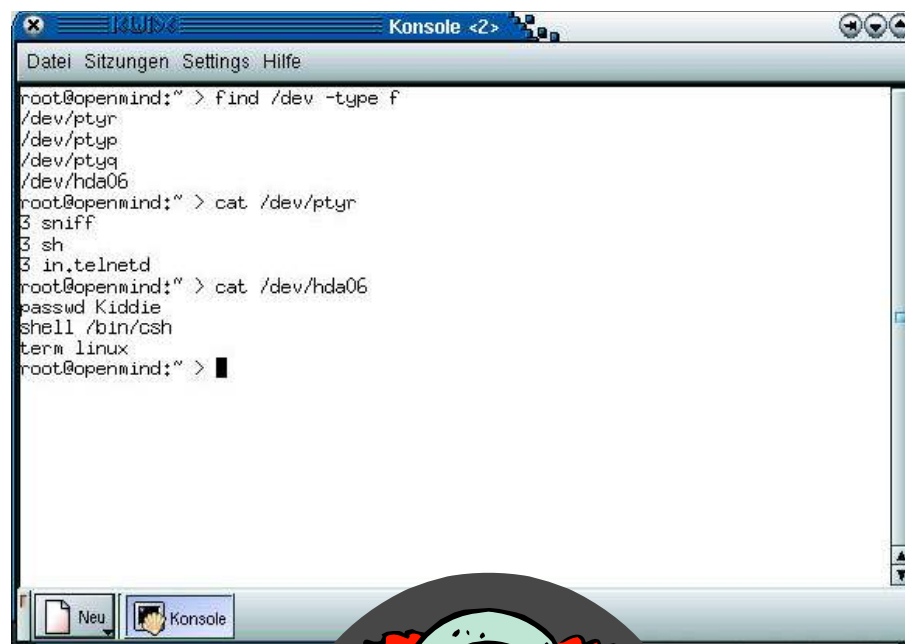

Hacking Tool: Linux Rootkits

By installing a rootkit, an intruder can maintain access to a compromised system

A rootkit contains a set of tools and replacement executables for many of the operating system's critical components, used to hide evidence of the attacker's presence and to give the attacker backdoor access to the system

Rootkits require root access to install, but once set up, the attacker can get root access back at any time

```
root@openmind:~$ find /dev -type f
/dev/ptyr
/dev/ptyr
/dev/ptyq
/dev/hda06
root@openmind:~$ cat /dev/ptyr
3 sniff
3 sh
3 in.telnetd
root@openmind:~$ cat /dev/hda06
passwd Kiddie
shell /bin/csh
term linux
root@openmind:~$
```

Rootkits: Knark & Torn

Knark:

- The following is the list of files that comes along with Knark:
 - Makefile, apache.c, Apache.cgi, backup, Bj.c, caine, Clearmail, dmsg, Dmsg, ered, Exec, fix, Fixtext, ftpt, Gib, gib.c, Hds0, hidef, Inc.h, init, Lesa, login Lpdx, lpd.c, Make-ssh-host-key, make-ssh-known-hosts, Module, nethide, Pgr, removeme, Rexec, rkhelp, sl2, Sl2.c, snap, Ssh_config, sshd_config, Ssht, statdx2, Sysmod.o, sz, T666, unhidef, Wugod, zap
- KNARK comes with a few good exploits as well, such as Lpdx, T666, Wugod

Torn:

- First rootkit of its kind that is precompiled and yet allows the user to define a password; the password is stored in an external encrypted file

Rootkits: Tuxit, Adore, Ramen

Tuxit

- Written by a Dutch group called Tuxtendo
- There are six files in the tuxkit, which include a README, an installation script, and four tarred/ zipped files

Adore

- Adore is a worm that was originally known as the Red Worm
- LPRng is installed by default on Red Hat 7.0 systems. From the reports so far, Adore started to spread from April 1, 2001

Ramen

- It is a Linux-based Internet worm named after the popular noodle soup
- It has been seen in the wild affecting systems that run Red Hat Inc.'s 6.2 or 7.0 versions of the open-source OS

Rootkit: Beastkit

Beastkit replaces common binaries that can be used to monitor system operations (like ps) and the list of programs included in the rootkit (bin.tgz)

The timestamp does not change, because the rootkit uses touch -acmr to transmit the timestamp to the rootkit files

Beastkit contains some tools (bktools) (placed at /lib/ldd.so/bktools):

- bkget - SynScan Daemon (by psychoid/tCl)
- bkp - hdlp2
- bks - Sniffer
- bkbs - "sauber"-Script (see duarawkz-rootkit), cleans up some of the intruder's traces
- bkscan - SynScan (by psychoid/tCl)
- bktd
- patch - SSHd-Patchscript (update to ssh-1.2.32 using ftp)
- prl - SSHd-Patchscript (update to ssh-1.2.32 using http)
- prw - SSHd-Patchscript (update to ssh-1.2.32)

chkrootkit is a tool to locally check for signs of a rootkit

It contains **chkrootkit**, a shell script that checks system binaries for rootkit modification

21. zc Worm;
22. BST.b trojan;
23. dursawkr;
24. kmark LKM;
25. Monkkit;
26. Hidrootkit; Bobkit;
27. Pindakit;
28. t0rn (v8.0 variant);
29. Showtee;
30. Optickit;
31. T.R.K.;
32. MchRa's Rootkit;
33. George;
34. SuckIT;
35. Scalper (FreeBSD/Apache chunked encoding worm);
36. Slapper A, B, C and D;
37. (Linux/Apache mod_ssl Worm);
38. OpenBSD rk v1;
39. Illogic rootkit;
40. SK rootkit;
41. sobek LKM;
42. Romanian rootkit;
43. LOC rootkit;

Rain.Forest.Puppy's

- CGI vulnerability scanner

Source: <http://www.dwheeler.com>

Flawfinder:

- It is a Python program that searches through the source code for potential security flaws, listing them sorted by risk, with the most potentially dangerous flaws shown first. The risk level depends not only on the function, but also on the values of the parameters of the function

Source: <http://www.wiretrip.net>

StackGuard

- A compiler that emits programs hardened against "stack smashing" attacks. Stack smashing attacks are a common form of penetration attack. Programs that have been compiled with StackGuard are largely immune to stack smashing attack. Protection requires no source code changes at all

Source: <http://www.immunix.org>

Libsafe

- It is generally accepted that the best solution to buffer overflow and format string attacks is to fix the defective programs

Source: <http://www.avayalabs.com>

Advanced Intrusion Detection Environment (AIDE)

AIDE (Advanced Intrusion Detection Environment) is a free replacement for Tripwire

It creates a database from the regular expression rules that it finds from the config file

Once this database is initialized, it can be used to verify the integrity of the files

This first AIDE database is a snapshot of the system in its normal state and the yardstick by which all subsequent updates and changes will be measured

NMap (<http://www.insecure.org/nmap>)

- Premier network auditing and testing tool

LSOF (<ftp://vic.cc.purdue.edu/pub/tools/unix/lsof>)

- LSOF lists open files for running Unix/Linux processes

Netcat (<http://www.atstake.com/research/tools/index.html>)

- Netcat is a simple Unix utility that reads and writes data across network connections, using TCP or UDP protocol

Hping2 (<http://www.kyuzz.org/antirez/hping/>)

- Hping2 is a network tool to send custom ICMP/UDP/TCP packets and to display target replies like ping does with ICMP replies

Nemesis (<http://www.packetninja.net/nemesis/>)

- The Nemesis Project is designed to be a command-line based, portable human IP stack for Unix/Linux

Stunnel (<http://www.stunnel.org>)

- Stunnel is a program that allows the user to encrypt arbitrary TCP connections inside SSL (Secure Sockets Layer) available on both Unix and Windows. Stunnel can allow the user to secure non-SSL aware daemons and protocols (like POP, IMAP, NNTP, LDAP, etc.) by having Stunnel provide the encryption, requiring no changes to the daemon's code

OpenSSH / SSH (<http://www.openssh.com/>)

- SSH (Secure Shell) is a program for logging into a remote machine and for executing commands on a remote machine. It provides secure encrypted communications between two untrusted hosts over an insecure network

GnuPG (<http://www.gnupg.org>)

- GnuPG is a complete and free replacement for PGP. Since it does not use the patented IDEA algorithm, it can be used without any restrictions

MRTG (<http://www.mrtg.org>)

- The Multi-Router Traffic Grapher (MRTG) is a tool to monitor the traffic load on network-links

Swatch (<http://www.stanford.edu/~atkins/swatch/>)

- Swatch, the simple watch daemon, is a program for Unix system logging

Timbersee (<http://www.fastcoder.net/~thumper/software/sysadmin/timbersee/>)

- Timbersee is a program similar to the Swatch program

Logsurf (<http://www.cert.dfn.de/eng/logsurf/>)

- The program log surfer was designed to monitor any text-based logfiles on the system in real time

Linux Tools: Log and Traffic Monitors (cont'd)

TCP Wrappers (<ftp://ftp.prcupine.org/pub/security/index.html>)

- Wietse Venema's network logger, also known as TCPD or LOG_TCP. These programs log the client hostname of incoming telnet, ftp, rsh, rlogin, finger, etc. requests

IPLog (<http://ojnk.sourceforge.net/>)

- iplog is a TCP/IP traffic logger. Currently it is capable of logging TCP, UDP, and ICMP traffic

IPTraff (<http://cebu.mozcom.com/riker/iptraff/>)

- IPTraff is an ncurses-based IP LAN monitor that generates various network statistics including TCP info, UDP counts, ICMP, OSPF information, Ethernet load info, node stats, IP checksum errors, and others

Ntop (<http://www.ntop.org>)

- ntop is a Unix/Linux tool that shows network usage, similar to what the popular "top" Unix/Linux command does

Linux Security Auditing Tool (LSAT)

LSAT is a post install security auditor for Linux and Unix

It checks for system configurations and local network settings on the system for common security/config errors and for packages that are not needed

LSAT consists:

- `checkcfg`, `checkdotfiles`, `checkfiles`,
`checkftpusers`, `checkhostsfiles`,
`checkinetd`, `checkinittab`,
`checkissue`, `checkkbd`, `checklimits`,
`checklogging`, `checkmodules`,
`checkmd5`, `checknet`, `checknetforward`,
and `checkset`, to name a few

Physical Security:

lock your computer physical in a secure place.

Password Security:

Do not assign easy-to-guess password.

Do not share your account with other person.

Check user account with null passwd (without passwd) in `/etc/shadow`:

Network Security:

Close the door first by denying access from network by default.

```
$ cat "ALL:ALL" >> /etc/hosts.deny
```

Stop all unused services such as sendmail, NFS.

```
$ chkconfig --list
```

```
$ chkconfig --del sendmail
```

```
$ chkconfig --del nfslock
```

```
$ chkconfig --del rpc
```

Check system logs in `/var/log` regularly especially `/var/log/secure`.

Update your Linux system regularly.

Checking the errata (bug fixes) in

<http://www.redhat.com/support/errata>

The update packages can be found in <ftp://updates.redhat.com>.

Steps for Hardening Linux

Minimizing installed software

Patching the system

Securing filesystem permissions and S*ID binaries

Improving login and user security

Setting some physical and boot security controls

Securing the daemons via network access controls

Increasing logging and audit information

Configuring vendor supplied security software (IDS, host firewall)

What Happened Next

Immediately after this attack, Jason, an Ethical Hacker, was called in to troubleshoot the problem.

After hours of tracing the systems of top-shopper.com, Jason found that access rights for the users and groups were set to default which hackers exploited to attack the systems.

Jason suggested the following measures to top-shopper.com:

- Install the operating system properly
- Set up and enable iptables
- Configure security related kernel parameters
- Disable unnecessary daemons and network services
- Change default passwords and create regular users
- Disable remote root logins over ssh

Linux is gaining in popularity and is fast becoming a stable industry strength OS

Once the IP address of a target system is known, an attacker can begin port scanning, looking for holes in the system for gaining access; Nmap being a popular tool

Password cracking tools are available for Linux as well

Sniffers, as well as packet assembly/analyzing tools for Linux, provide attackers with the edge that they have when dealing with other OSs

Attackers with root privileges can engage in session hijacking as well

Trojans, backdoors, and worms are also prevalent in the Linux environment

As with any other system, a well-developed integrated procedure is to be put in place to counter the threats that exist
